

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

Amendment to the Claims:

This listing of claims replaces all prior versions, and listings, of claims in the application:

- A1
1. (Currently amended) A system, comprising:
- a data source, having a plurality of different lines;
- a plurality of programmable delay elements, each coupled to one of said plurality of lines, to control a delay in said one of said lines to produce delayed values; and
- a register, storing values for said programmable delay elements which respectively control an amount of delay caused by said delay elements;
- an arbitration logic, coupled to said plurality of delayed values, and operating to determine relative timing of said plurality of lines, wherein said arbitration logic includes a first element which produces a set of first values for said register, and a second element which determines relative arrival of signals based on said first values, and wherein said arbitration logic dithers between different sets of values, and determines which of said plurality of values produces a best desired result, and stores said best result.

AI  
2. (Original) A system as in claim 1, wherein there are one of said programmable delay elements for each of said plurality of lines.

3. (Original) A system as in claim 1, wherein said register stores a plurality of values, each of said plurality of values controlling one of said programmable delay elements.

4. (Original) A system as in claim 3, further comprising a non volatile memory, storing said plurality of values.

5-7. (Cancelled)

8. (Original) A system as in claim 1, further comprising a graphics device, and wherein said signals are from said graphics device.

9. (Original) A system as in claim 1, further comprising a non-volatile memory, storing values for said delay elements, and loading said values into said register at a specified time.

10. (Cancelled)

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

11. (Currently amended) A system as in claim [[10]] 1, wherein said best result is one where the plurality of delayed signals are received at substantially the same time.

Al  
12. (Original) A system as in claim 10, wherein said best result is one where the plurality of delayed signals are received at a time skew that allows certain logic elements to operate correctly.

13. (Currently amended) An electronic device, comprising:  
a first device producing a plurality of first outputs;  
a plurality of programmable delay elements, each of said plurality of programmable delay elements connected at one end to one of said plurality of outputs and each producing a second output which is delayed relative to said first outputs;

a levelization register, storing a plurality of values, said values each individually controlling one of said delay elements to control an amount of delay caused by said delay element to one of said plurality of outputs; and

arbitration logic, connected to each of said second outputs, and determining a relative delay among said second outputs, and wherein said arbitration logic is responsive to a

system event flag, which indicates a specified event in the  
system.

14 - 15. (Canceled)

16. (Currently amended) A device as in claim [[15]] 13,  
wherein said specified event is a hardware change.

17. (Currently amended) A device as in claim [[15]] 13,  
wherein said specified event is a system crash.

18. (Currently amended) A system as in claim [[15]] 13,  
wherein said arbitration logic is responsive to said flag to  
produce ~~a first~~ multiple sets of values for said levelization  
register, command said first device to produce said signals for  
each of said sets of values, and determine a relative delay  
among said signals based on said ~~first sets~~ sets of values and stores  
a best set of values as levelization values.

19. (Currently amended) A system as in claim [[14]] 13,  
further comprising a non volatile memory which stores  
levelization values, said arbitration logic storing said  
levelization values in said non volatile memory.

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

Al  
20. (Currently amended) A system as in claim [[15]] 13, further comprising, at initial system start up, downloading values from said non volatile memory to said levelization register.

21. (Currently amended) A system as in claim [[15]] 13, wherein said programmable delay elements are phase locked loops.

22. (Currently amended) A method comprising:  
receiving a plurality of signals from an external device,  
each of said plurality of signals related to each other; and  
programmably delaying some of said signals relative to  
others of said signals according to prestored values; and  
determining if a system event has occurred, and storing new  
delay values in said non volatile memory responsive to said  
system event occurring.

23. (Original) A method as in claim 22, wherein plurality of signals are signals from a bus.

24. (Original) A method as in claim 23, wherein said plurality of signals are signals from a graphics bus.

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

25. (Original) A method as in claim 22, wherein said delaying comprises storing delay values in a non volatile memory; and

A/ using said values in said non volatile memory to adjust a value of a programmable delay element.

[[25]] 26. (Cancelled)

[[26]] 27. (Currently amended) A method as in claim 25 wherein said system event is a change in system hardware configuration.

[[27]] 28. (Currently amended) A method as in claim [[25]] 26, wherein said system event is a system crash.

[[28]] 29. (Currently amended) A method as in claim [[25]] 26, wherein said reobtaining comprises dithering sets of values in a register that stores values for said programmable delay, determining results, and accepting a set of values which have produced a specified delay.

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

[[29]] 30. (Currently amended) A method as in claim [[28]]  
29, further comprising storing said values in said non-volatile  
memory.

Al  
[[30]] 31. (Currently amended) A method as in claim [[28]]  
29, wherein said specified delay is a result where there is a  
minimal delay between arrival of all signals.

[[31]] 32. (Currently amended) A method as in claim [[28]]  
29, wherein said specified delay is a result where there is a  
specified delay between arrival of all signals which allows for  
clock skew in at least one specified logic element.

[[32]] 33. (Currently amended) A method of equalizing  
time delays of signals, comprising:

providing a plurality of signals which are produced in  
times that are synchronized with one another;

providing sets of values which represent different sets of  
delay values for said plurality of signals using one of said  
sets to delaying each of said plurality of signals by a  
respective amount, wherein each of said respective amounts is  
different than each other respective amount for a different one  
of said signals based on said delay values;

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

testing said signals, to determine relative amounts of  
delays in said signals, to produce said delay amount;

repeating and using said testing to find a best one of said  
sets; and

AL using said delay amounts from said best one of said sets to  
delay said signals.

[[33]] 34. (Currently amended) A method as in claim [[32]]  
33, wherein said plurality of signals are signals from a  
graphics processing device.

[[34]] 35. (Currently amended) A method as in claim [[32]]  
33, wherein said delaying comprises delaying each of the signals  
by respective amounts which causes them to arrive at a specified  
location at substantially similar times.

[[35]] 36. (Currently amended) A method as in claim [[32]]  
33, wherein said delaying comprises delaying said signals by  
specified amounts which causes them to arrive at said location  
at specified times which are skewed relative to one another,  
wherein said skew is related to a clock margin of a system.

[[36]] 37. (Currently amended) A method of setting delays  
in a system, comprising:

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

storing values indicative of time delays in a register,  
said time delays representing delays to be applied to signals to  
obtain a specified result;

Al detecting a system event which indicates that said time  
delays should be changed;

when said system event is not detected, using said values  
in said register to cause signal delays, by applying said values  
to respective programmable delay elements; and

only when said system event is detected, using a logic  
element to determine new delay values and applying said new  
delay values to said programmable delay elements to cause signal  
delays based on said new delay values.

[[37]] 38. (Currently amended) A method as in claim [[36]]  
37, wherein said using comprises applying a plurality of delay  
values to a plurality of respective programmable delay elements  
to thereby delay a plurality of lines.

[[38]] 39. (Currently amended) A method as in claim [[36]]  
37, further comprising storing said new delay values in a non-  
volatile memory.

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

[[39]] 40. (Currently amended) A method as in claim [[36]]  
37, wherein said system event includes a change of system  
components.

Al [[40]] 41. (Currently amended) A method as in claim [[36]]  
37, wherein said system event is an operating system crash.

[[41]] 42. (Currently amended) A method, comprising:  
receiving a plurality of signals in parallel from a  
specified device, which signals are produced at substantially  
synchronized times;  
applying said plurality of said signals to programmable  
delay devices which allow individual delay of said signals; and  
controlling said plurality of programmable delay devices to  
allow the signals to arrive to at least one specified location  
in a specified way; and

wherein said specified way is that said signals are have a  
specified relationship to one another at said at least one  
specified location, which specified relationship is not  
synchronized, to allow a system to work properly.

[[42]] 43. (Cancelled)

Attorney Docket No. 10559-350001  
Application No. 09/662,054  
Amendment dated December 4, 2003  
Reply to office action dated October 6, 2003

[[43]] 44. (Cancelled)

*A1  
erel*  
[[44]] 45. (Currently amended) A method as in claim [[41]]  
42, further comprising storing said information in a non-  
volatile memory.

46. (New) A system as in claim 1, further comprising a  
system event detector which produces a system event notification  
responsive to a specified event in the system; and

wherein said arbitration logic operates to determine said  
values only responsive to said system event detector.

47. (New) A system as in claim 46, wherein said system  
event is a change in hardware.
